It occurs in the plasma of trace amounts after birth. The serum level in adults is usually less than 40 mg/ml. AF C.Comment: Ruman AFP binds copper, nickel, and fatty acids as well as, and the bilitabin
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 A;Molecule type: protein

Natl. Acad. Sci. U.S.A. 90:2409-2413(1933)

-!- FUNCTION: Serum albumin, the main protein of plasma, has a good binding capacity for water, Ca(2+), Na(+), K(+), fatty acids, hormones, bilirubin and drugs. Its main function is the regulation of the colloidal osmotic pressure of blood.
-!- SUBCELJULAR LOCATION: Secreted.

Allergy Clin. Immunol. 93:614-627(1994).

-!- FUNCTION: Serum albumin, the main protein of plasma, has a good binding capacity for water. (a(2+), Na(+), K(+), fatty acids, hormones. billirubin and drugs. Its main function is the regulation of the colloidal osmotic pressure of blood.
-!- SUBCELULIAR LOCATION: Secreted.
-!- SIMILARITY: BELONGS TO THE ALB/AFP/VDB FAMILY.
-!- SIMILARITY: Contains 3 albumin domains.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 SEQUENCE OF 25-48.

-!- FUNCTION: Serum albumin, the main protein of plasma, has a good binding capacity for water. (a(2+), Na(+), K(+), fatty acids, binding capacity for water. (a(2+), Na(+), K(+), fatty acids, hormones, bilitubin and drugs. Its main function is the regulation of the colloidal osmotic pressure of blood.
-:- SUBCELLUIAR LOCATION: Secreted.
-:- SIMILARITY: BELONGS TO THE ALB/AFP/VDB FAMILY.
-:- SIMILARITY: Contains 3 albumin domains.

"Mouse liver protein database: a catalog of proteins detected by two-dimensional gel electrophoresis.";

Electrophoresis 13:970-99. [1992.]

-!- FUNCTION: Serum albumin, the main protein of plasma, has a good binding capacity for water, Ca(2+), Na(+), K(+), fatty acids, hormones, bilirubin and drugs. Its main function is the regulation of the colloidal osmotic pressure of blood.
-!- SUBCELLULAR LOCATION: Secreted.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      SECUENCE OF 99-516 FROM N.A. Blophys. Res. Commun. 78:1060-1066(1977).

-!- FUNCTION: Serum albumin, the main protein of plasma, has a good birding capacity for water. Ca(2+), Na(+), K(+), fatty acids, hormones, bilirubin and drugs. Its main function is the regulation of the colloidal osmotic pressure of blood.
-!- SUBCELULAR LOCATION: Secreted.
-!- SIMILARITY: BELONGS TO THE ALB/AFP/VDB FAMILY.
-!- SIMILARITY: Contains 3 albumin domains.

THE SENUM LEVEL IN ADDLTS IS USUALLY LESS THAN 40 NG/ML. AFP OCCURS ALSO AT HIGH LEVELS IN THE PLASMA AND ASCITIC FLUID OF ADJLTS WITH HEPATOMA. TENNENDENDENT STUDIES SUGGEST HETEROGENEITY OF THE AMINOTERMINAL SEQUENCE OF THE MATURE PROTEIN AND OF THE CLEAVAGE SITE OF THE SIGNAL SEQUENCE.
                                                                                                                                                                                                                                                                                C. Natl. Acad. Sci. U.S.A. 82:7160-7164 (1985).
FUNCTION: BINDS COPPER, NICKEL, AND FATTY ACIDS AS WELL AS, AND STIRRUEN LESS WELL THAN, SERUM ALBUMIN. CNLY A SMALL PERCENCAGE (LESS THAN 2%) OF THE HUMAN AFP SHOWS ESTROGEN-BINDING PROPERTIES. SUBUNIT: DIMERIC AND TRIMERIC FORMS HAVE BEEN FOUND IN ADDITION TO THE MONOMERIC FORM.
                                                                                                                                  MEDLINE=80001710; PubMed=89900;
